

Design stunning landscapes in less time.

Realtime Landscaping

PRO™

Version 4

New Features in Realtime Landscaping Pro 4

New Plants and Other Objects

Added 800 high-resolution plants, 250 accessories, and 30 patio materials. Total is now 8200 objects, including 4000 plants and 1000 accessories.

New Selection Commands

It's now easier to select objects, especially in complex landscapes. Select objects by type or similarity to other objects. Select plants by name, planting zones, or other criteria. Improved highlighting and selection tool makes it easier to select overlapping objects.

Performance Enhancements

Rendering performance is now over 2X faster when working with large landscapes. Rendering, movement, scaling, rotating, and other options are significantly faster when working with landscapes consisting of thousands of plants.

Deck Improvements

All new deck designer supports curved decking and railing, improved deck framing, and wrap-around deck stairs.

Deck Wizard

The new *Deck Wizard* helps you to add a new deck with just a few mouse clicks. Includes 27 styles of decking.

Plant Creation Wizard

The new *Plant Creation Wizard* makes it much easier to create new plant varieties, a feature which has been requested by many users. Quickly change the color or tint of a plant, or use the integrated picture editor for more complex changes.

Fence Improvements

Added 15 new fence styles, shadow box board layout option, and Mediterranean and Contemporary board types. New wood panel fencing has also been added.

Shape Booleans

Create complex shapes by adding, subtracting, and intersecting existing shapes. For example, you can cut a hole in a deck to make room for a hot tub.

Lot Boundaries and Property Lines

The new Lot Boundary tool makes it easier to enter relative dimensions and survey bearings.

Now over 8200 objects.

Curved decking, railing, and wrap-around stairs.

New boolean commands for creating complex shapes.

Enhanced Rendering Quality

Shadows and lighting are now more realistic during realtime walkthroughs. Improved gamma settings help colors appear more natural, especially on LCD monitors. New *detail texture* technology significantly reduces the “checkboard” effect that occurs when viewing repeating textures at a distance. This makes fill regions, patios, and other materials more realistic.

Layer-Based Project Material Lists

Project material lists can now be created just for visible layers. This makes it easier to create material lists for specific parts of your landscape design.

3D Text

3D text can now be created and used in realtime walkthroughs. This is useful for creating movies and presentations that show client names and callouts.

Realtime Landscaping Photo 4

The software includes the full version of Realtime Landscaping Photo 4, which has also been enhanced and updated.

Vista-Specific Improvements

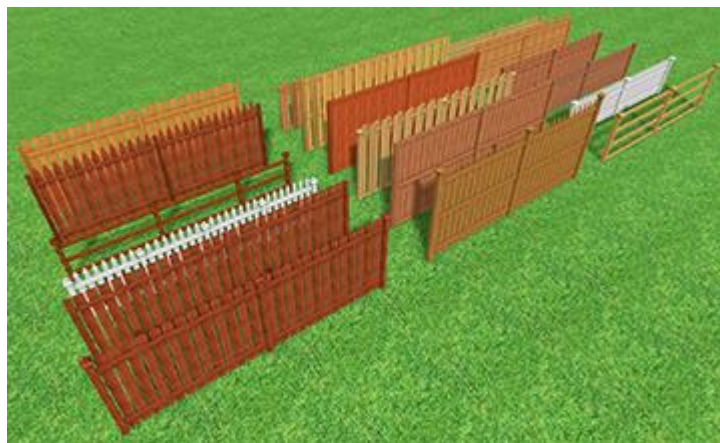

The installation program is now fully compliant with Microsoft Vista MSI standards. This makes installations and upgrades easier.

User Interface Improvements

A help button is now displayed in the property window for all object types, making it easier for new users to get help. Houses and other shapes can now be created using keyboard entry of angle and distance. For example, this makes it easier to create a house over a scanned floor plan. The area and perimeter is now displayed for most objects in the property window. 120 and higher DPI font sizes are now supported. The software also includes many other improvements based on customer feedback.
